

Illustration of Cleared by Parentage

DNA testing is a great tool that lets us understand what disease traits our dogs may carry. If Parents have been tested for the disease, the next two generations need not be tested. Generation 1 and 2 are said to be **Cleared by Parentage**. Note: Subsequent offspring needs to be tested.

Note: EIC is exercise-induced-collapse. PRA or progressive retinal atrophy is a condition of the retina in the eye. It is genetic and causes blindness. DNA testing can discover carriers or dogs affected with the disease.
